

Groww: Improving Instrument Discovery with Quick Watchlist Actions

Groww is a popular investing platform used by retail investors to discover and invest in stocks, mutual funds, indices, and other financial instruments. A UX audit revealed friction in how users save instruments while browsing listing screens.

// DESIGN PRINCIPLE

“Support user intent at the moment it occurs.”

// CORE INSIGHT

During browsing, user intent is often a quick scan followed by a quick save. Requiring detail-page navigation breaks momentum and adds friction at the most common interaction point.

// THE CHALLENGE

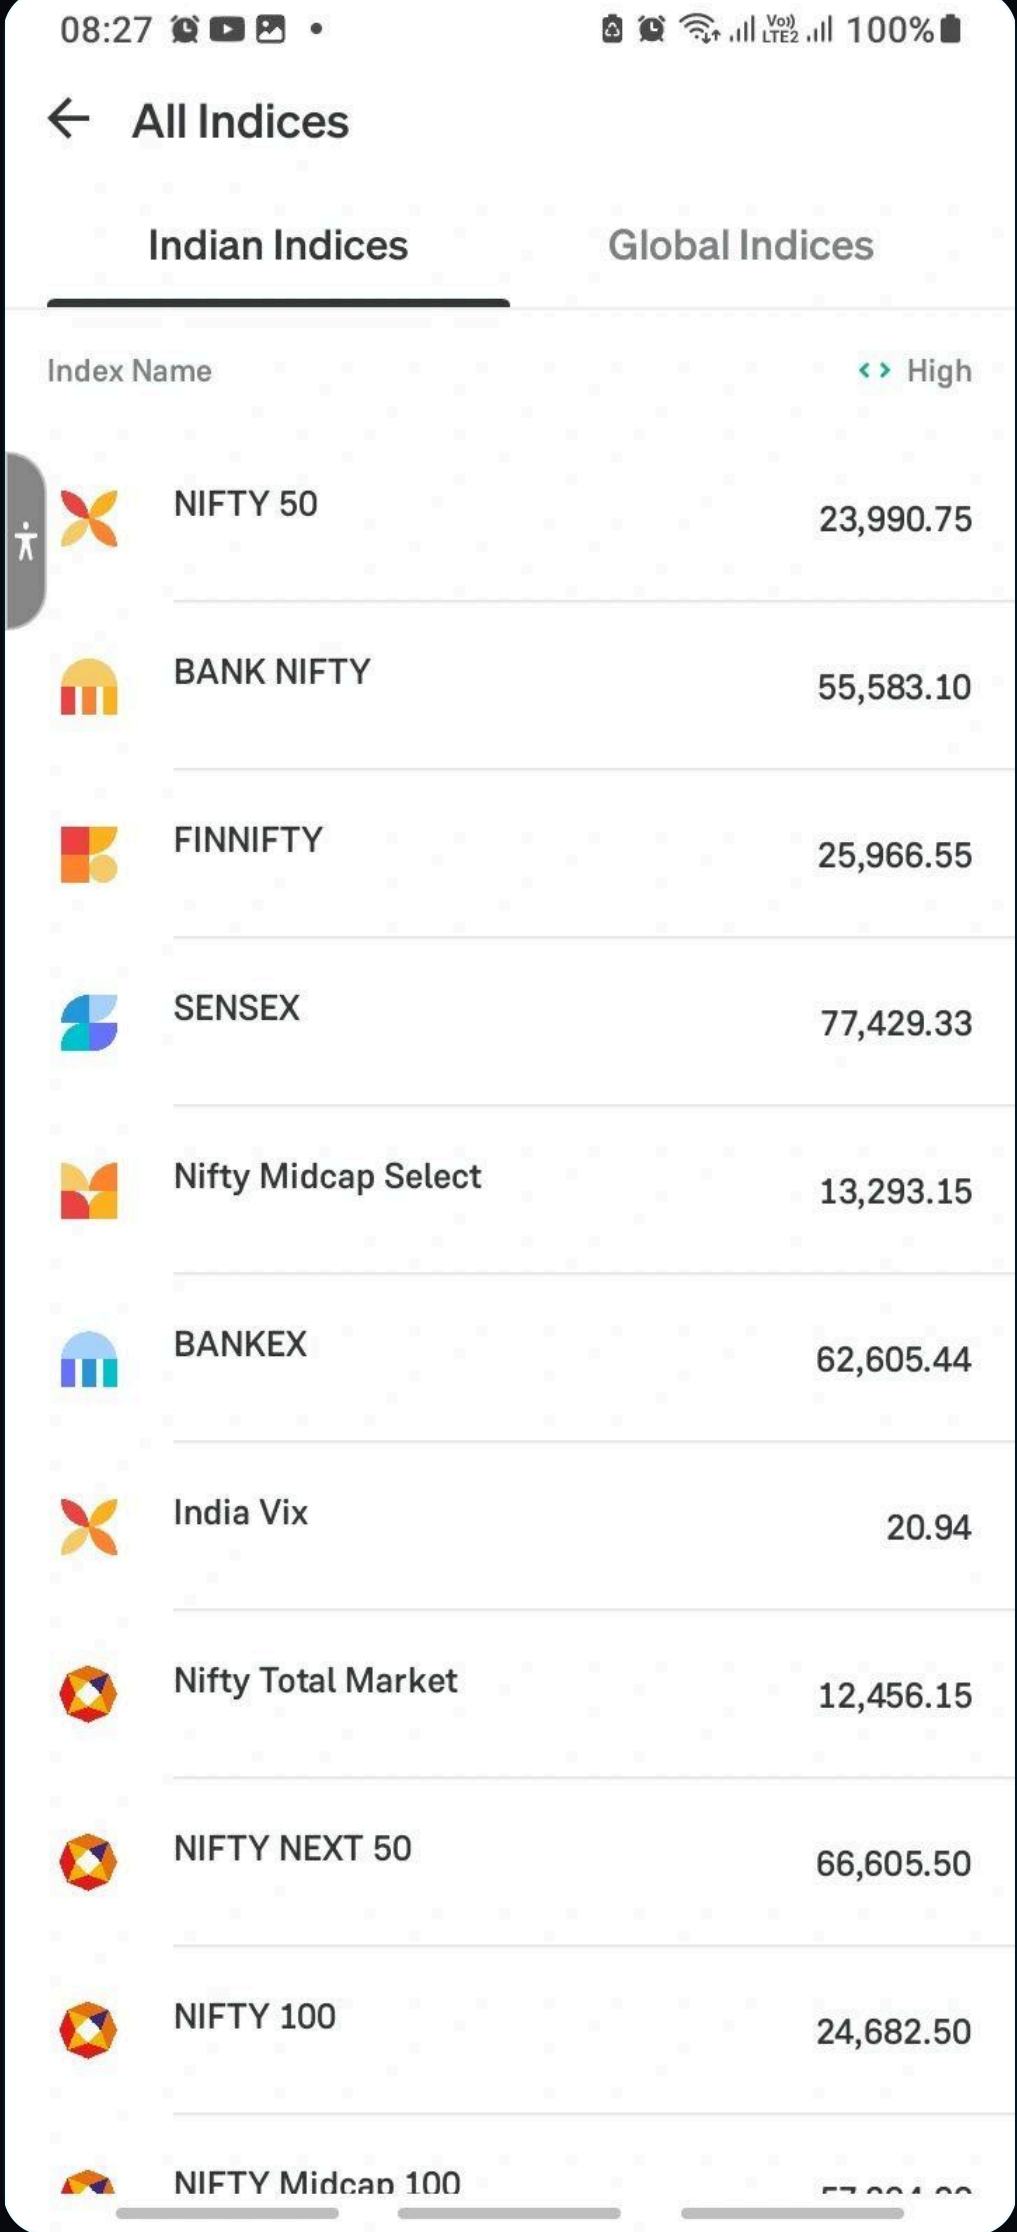

Users exploring multiple instruments cannot bookmark or add items to a watchlist directly from the listing screen. They must first open each instrument detail page — creating an unnecessary extra step that interrupts browsing momentum.

// OBSERVED PROBLEMS

- 1 No quick-save option from the browse or listing screen
- 2 Extra taps required to add watchlist items
- 3 Interrupted browsing and comparison flow
- 4 Slower discovery workflow for active investors

// EXISTING STATE

The problem in context.

Groww All Indices listing existing state — no inline watchlist action visible at the row level, requiring users to navigate into each instrument detail page.

// PROBLEM → SOLUTION

The proposed solution.

Add a bookmark star icon or '+ Watchlist' CTA at the instrument row level — so users can save items instantly without leaving the current listing screen.

// WHY THIS WORKS

- Faster decision-making during browsing sessions
- Easier comparison of multiple instruments side-by-side
- Improved efficiency for frequent traders
- Better engagement with the watchlist feature

// BEFORE

Open Instrument → Navigate to detail page → Add to watchlist.

// AFTER

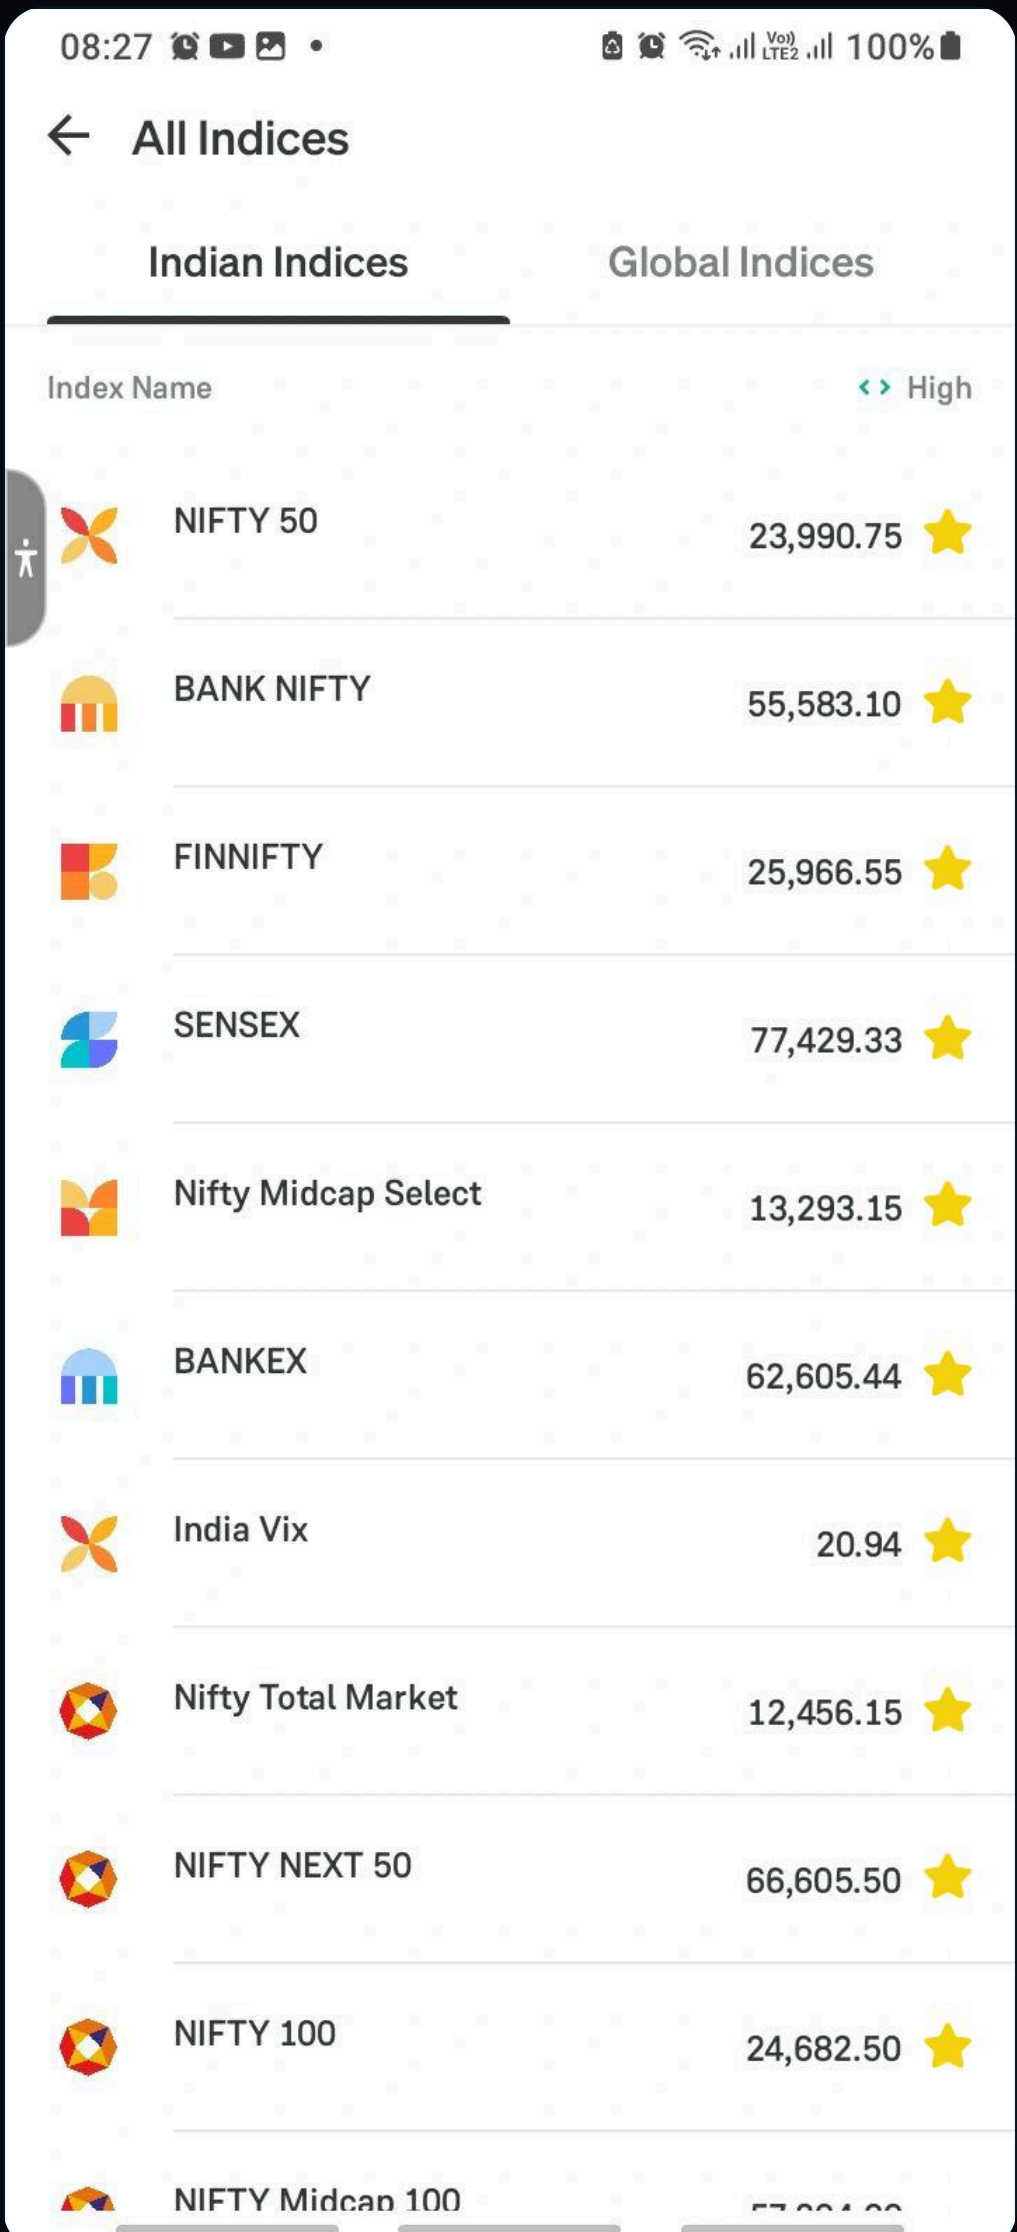

Browse screen → Tap star → Saved instantly.

// EXPECTED IMPACT

- 35% faster watchlist additions
- 25% increase in watchlist feature usage
- Reduced drop-off during discovery journeys
- Higher repeat sessions from active users

// REDESIGNED STATE

The solution in context.

Proposed solution — a star icon or "+ Watchlist" CTA added directly to each instrument row, enabling instant saves without leaving the listing screen.

// KEY LEARNING

“Meaningful UX improvements often come from reducing micro-frictions in everyday actions.”
